

Studies and scientific research in the Santa Catarina Nursery WHA

The community of Santa Catarina supports and actively participates in scientific research to improve understanding and protection of cetaceans and their habitats. The area benefits from ongoing, long-term independent conservation and research efforts carried out by a range of stakeholders, including NGOs, academic institutions, and government agencies. These efforts have generated a substantial body of evidence that demonstrates the importance of the region as a nursery ground for right whales. This includes a record of past and ongoing research programs and studies, a list of peer-reviewed scientific publications focused on right whales in the area, and evidence of strong partnerships with academics, local NGOs and universities.
