We understand the need of collaboration between the community, conservation organizations, and government bodies to be a factor of the well-being of mountain gorillas and the overall health of the ecosystem and the communities that live in close proximity to these natural treasures.

We engage the community to actively engaged in various aspects of conservation and conducting research on mountain gorillas, for them to understand the behaviour, habitat needs, and potential threats of the mountain gorillas . This knowledge forms the basis for informed conservation strategies and involves monitoring gorilla populations, studying their social structures, and tracking their movements. We also educate the community to preserve the natural habitat of mountain gorillas, by preventing deforestation, combating illegal logging, and ensure the overall health of the ecosystem.
We also involve the community in initiatives that restore and enhance biodiversity, by teaching them the need of planting native vegetation, reintroducing native species, and putting in place measures to prevent poaching, addressing human-wildlife conflict, and implementing policies to ensure the responsible and sustainable tourism that allows people to observe gorillas without disturbing their natural behaviours.
